

kopi satset.

Operating plan and financial model

Ten-cart launch in Surabaya, two-price product line, banded seller remuneration, full reinvestment of operating cash flow.

200

Rp million sought in the initial round, in equity

150

Rp million committed to date

20%

of the equity for the round, at 1% per Rp10 million

At a glance

Kopi Satset will sell iced coffee from electric carts in Surabaya. Coffee is cold-brewed in one kitchen, carried in sealed jugs and poured over ice at the kerb. The entry cup is Rp6,000 and the main cup Rp8,000. This book sets out the unit economics, the cost structure, the capital plan and the growth model behind the initial funding round of Rp200m.

Rp200m

initial round in equity, of which Rp150m is committed

Rp57.1m

monthly EBITDA at ten carts and 70 cups per cart-day

41.4%

EBITDA margin on revenue of Rp137.8m

6.9 cups

per cart-day to break even on EBITDA

Month 2

by which investors have received their first Rp100m, base scenario

78 carts

trading by month 12 in the base scenario, funded from cash flow

How figures are labelled

Every figure carries one of five designations. A calculation that consumes an assumption is a model output.

fact set or confirmed by management **calculation** arithmetic on facts **assumption** not yet observed
hypothesis an estimate to be tested **model output** arithmetic that rests on an assumption

The initial round

Initial round

Sought, in equity	Rp200.0m
Committed to date	Rp150.0m
Still open	Rp50.0m
Equity for the round, at 1% per Rp10m	20%
Implied value of the whole company	Rp1,000m
First dividends to investors, 50% of their capital	Rp100.0m

Investors receive the first Rp100m of operating cash flow as dividends. All cash flow after that is reinvested in carts. The growth model in Section 11 is built on that order.

1 Business overview

Coffee is cold-brewed in batches at a central kitchen, carried in sealed jugs and poured over ice at the point of sale. Nothing is brewed on the cart. Service is a pour, so peak throughput does not limit sales. Ten carts are deployed at launch and the network expands from retained cash flow.

Two products are sold. The Rp6,000 cup opens the price point and is capped per cart-day, and the Rp8,000 cup carries all volume beyond the cap. The model sets the cap at 15 cups. Below 25 cups a day the mix runs at 60% Rp6,000, and above it every further cup is sold at Rp8,000. The cap lets the entry price recruit buyers without diluting the economics of a strong site.

The product is a commodity at these prices. The asset the venture builds is its distribution network: a mapped set of pavements with known hourly demand, and a kitchen able to supply them every day.

2 Unit economics

fact Cost of goods is stated all-in per cup sold and covers ingredients, packaging, water, ice and payment fees.

Per cup, Rp	Rp6,000 cup	Rp8,000 cup
Selling price	6,000	8,000
Cost of goods sold	(2,000)	(2,200)
Seller commission	(700)	(1,000)
Contribution before wastage	3,300	4,800
Gross margin	66.7%	72.5%

Where the price goes, Rp6,000 cup

2,000	700	3,300
Cost of goods		Contribution

Where the price goes, Rp8,000 cup

2,200	1,000	4,800
Cost of goods		Contribution

Sales mix and blended contribution

calculation The Rp6,000 volume is fixed at 15 cups once a cart passes 25 cups a day, and all further cups are Rp8,000.

Cups per cart-day	Rp6k cups	Rp8k cups	Revenue per day	Contribution per day	Blended contribution per cup
10	6	4	68,000	39,000	3,900
25	15	10	170,000	97,500	3,900
30	15	15	210,000	121,500	4,050
40	15	25	290,000	169,500	4,238
50	15	35	370,000	217,500	4,350
70	15	55	530,000	313,500	4,479
100	15	85	770,000	457,500	4,575
150	15	135	1,170,000	697,500	4,650

Blended contribution per cup, by cups per cart-day (Rp)

Blended contribution improves with volume because the entry cup stays at 15 units while growth arrives at Rp8,000. A strong site therefore earns more per cup as well as in total. Contribution is a gross measure: it is stated before wastage (Section 4), the performance bonus (Section 3) and the costs in Section 5.

3 Seller remuneration

fact Sellers earn Rp700 on each Rp6,000 cup and Rp1,000 on each Rp8,000 cup, plus a monthly performance bonus from 30 cups a day. Commission alone runs at 12.1% to 12.4% of revenue across the range, so the bonus carries the visible incentive. The bonus is paid monthly and is gated on attendance.

A separate motivation fee applies at the 30 and 40 cup bands. It is not published as part of the pay structure and is payable for at most two consecutive months. It holds a new or underperforming seller at about Rp1.8m while the site is proved. The table shows the ladder as the seller sees it and the all-in cost during the two fee months.

Cups per day	Rp6k	Rp8k	Sales per month	Commission	Bonus	Visible pay	Increment	Motivation fee	All-in, months 1 and 2
10	6	4	1.768m	213k		213k			213k
20	12	8	3.536m	426k		426k	+213k		426k
30	15	15	5.460m	663k	500k	1.163m	+737k	600k	1.763m
40	15	25	7.540m	923k	550k	1.473m	+310k	327k	1.800m
50	15	35	9.620m	1.183m	650k	1.833m	+360k		1.833m
60	15	45	11.700m	1.443m	800k	2.243m	+410k		2.243m
70	15	55	13.780m	1.703m	1.000m	2.703m	+460k		2.703m
80	15	65	15.860m	1.963m	1.200m	3.163m	+460k		3.163m
90	15	75	17.940m	2.223m	1.350m	3.573m	+410k		3.573m
100	15	85	20.020m	2.483m	1.400m	3.883m	+310k		3.883m
120	15	105	24.180m	3.003m	1.500m	4.503m	+310k		4.503m
140	15	125	28.340m	3.523m	1.600m	5.123m	+310k		5.123m
150	15	135	30.420m	3.783m	4.100m	7.883m	+2.760m		7.883m

Visible monthly pay per seller: commission plus bonus (Rp million)

■ Commission ■ Performance bonus

The fee is a ramp subsidy

A new cart trades at 60% of mature volume in its first month and 85% in its second. The fee is payable for those two months. Exposure is capped at Rp6.0m a month across ten carts at 30 cups and Rp3.27m at 40 cups.

Its withdrawal is felt

When the fee ends, a 30-cup seller's pay falls 34% and a 40-cup seller's 18%. At a site capable of 50 cups this works as intended. At a weaker site month 3 becomes an attrition point, and seller departure and site failure arrive together.

Employee cost settles at 18% to 20% of revenue from 50 cups upward, the range the structure is built for.

The ladder resists gaming to 140 cups

Increments of Rp310k to Rp460k per ten cups are far below the roughly Rp2.08m a seller would spend buying ten cups a day for a month.

The 150-cup band is the exception

Its Rp2.76m step exceeds the cost of buying across, and a cart moving from 140 to 150 cups lowers group EBITDA by about Rp13.3m a month. No site is expected to reach it. The band is reviewed if any cart passes 120 cups.

4 Load sizing and wastage

Carts are loaded before demand is known. Wastage depends on the load ratio, which is stock prepared divided by stock sold, and it is carried as its own cost line.

fact Unsold prepared stock costs Rp1,150 per Rp6,000 cup and Rp1,200 per Rp8,000 cup. This is the brewed liquid only. Cups, lids and ice are not committed until the pour.

Load ratio	Wastage per cup sold	Blended contribution at 50 cups	At 70 cups
1.00×	0	4,350	4,479
1.10×	119	4,232	4,360
1.19×	225	4,125	4,253
1.25×, planning basis	296	4,054	4,181
1.50×	592	3,758	3,884
2.00×	1,185	3,165	3,289

Balancing lost sales against waste gives a load of 1.25× for the Rp8,000 cup and 1.19× for the Rp6,000 cup, at 30% day-to-day variation in demand. The entry cup should be loaded thinner.

Blended contribution per cup after wastage, by load ratio (Rp)

Monthly cost of loading at 2.00× instead of 1.25×, ten carts (Rp million)

model output Load discipline is a margin lever that does not depend on sales. At 50 cups, tightening the load ratio from 2.00× to 1.25× adds Rp11.6m a month across ten carts. At 100 cups it adds Rp23.3m.

Break-even

Load ratio	EBITDA break-even	Accounting break-even
1.25×	6.9 cups per cart-day	13.1 cups per cart-day

Operating rule

Load is set per cart and per product from that site's trailing seven-day median, at a ratio of 1.25×, and reviewed weekly. A fixed group-wide batch is not operated. A day with nil wastage is logged as a stock-out, because it understates demand and would set the next load too low.

5 Revenue allocation and cost structure

model output Ten carts at 70 cups per cart-day, monthly. Costs are classified by behaviour. Variable costs move with every cup sold, stepped costs move in increments as volume bands or staffing thresholds are crossed, and fixed cash costs do not move with volume at a given cart count.

Class	Cost item	Per month	% of revenue	Behaviour
Variable	Cost of goods sold	39.26m	28.5%	Per cup sold, by product
	Seller commission	17.03m	12.4%	Rp700 or Rp1,000 per cup
	Wastage on unsold stock	5.41m	3.9%	Load ratio × cups sold
	Total variable	61.70m	44.8%	
	Contribution	76.10m	55.2%	
Stepped	Performance bonus	10.00m	7.3%	Steps at each 10-cup band
	Kitchen labour	5.20m	3.8%	One person per 400 cups a day
	Total stepped	15.20m	11.0%	
Fixed cash	Replenishment and sundry	2.60m	1.9%	Per cart-day
	Vehicle charging	0.78m	0.6%	Per cart-day
	Telemetry hosting and SIM	0.45m	0.3%	Server and ten SIMs
	Total fixed cash	3.83m	2.8%	
	EBITDA	57.07m	41.4%	
Non-cash	Depreciation	5.89m	4.3%	Carts and trackers 24 months; other assets 36
Tax	Final tax on turnover	0.69m	0.5%	While turnover is below Rp4.8bn
	Net profit	50.49m	36.6%	

Where each Rp8,000 goes

Rupiah per Rp8,000 of revenue, ten carts at 70 cups

Of each Rp8,000 of revenue, Rp2,280 goes to ingredients and packaging, Rp989 to commission, Rp314 to wastage, Rp581 to the performance bonus, Rp302 to kitchen labour, Rp196 to replenishment and charging, Rp26 to telemetry, Rp342 to depreciation and Rp40 to tax. Rp2,931 is retained as net profit.

Operating leverage

Measure	1 cart	10 carts	97 carts
Variable cost, % of revenue	44.8%	44.8%	44.8%
Contribution margin	55.2%	55.2%	55.2%
Stepped cost, % of revenue	26.1%	11.0%	10.6%
Fixed cash cost, % of revenue	2.8%	2.8%	5.5%
EBITDA margin	26.3%	41.4%	39.2%
Degree of operating leverage	2.10	1.33	1.41

Operating leverage is low. About 45% of revenue is variable and under 3% is fixed cash cost, so a 10% move in revenue moves EBITDA by about 13%. A café that carries rent and fixed staff typically runs at three to five times that.

Margin peaks near ten carts. One cart carries the whole kitchen, ten carts spread it, and at 97 carts supervision enters the cost base.

6 Income statement

model output Monthly, at 70 cups per cart-day and a 1.25× load ratio. The one-cart column carries the full kitchen. The ten-cart column is the launch configuration. The 97-cart column shows the model at scale.

Rp million	1 cart	10 carts	97 carts
Revenue	13.78	137.80	1,336.66
Cost of goods sold	(3.93)	(39.26)	(380.82)
Seller commission	(1.70)	(17.03)	(165.19)
Wastage	(0.54)	(5.41)	(52.49)
Contribution	7.61	76.10	738.16
Performance bonus	(1.00)	(10.00)	(97.00)
Kitchen labour	(2.60)	(5.20)	(44.20)
Replenishment and sundry	(0.26)	(2.60)	(25.22)
Vehicle charging	(0.08)	(0.78)	(7.57)
Telemetry hosting and SIM	(0.04)	(0.45)	(4.37)
Supervision	0	0	(36.00)
EBITDA	3.63	57.07	523.81
EBITDA margin	26.3%	41.4%	39.2%
Depreciation	(2.04)	(5.89)	(46.38)
EBIT	1.59	51.18	477.43
Taxation	(0.07)	(0.69)	(105.03)
Net profit	1.52	50.49	372.40
Net margin	11.0%	36.6%	27.9%

From revenue to net profit, ten carts, one month (Rp million)

Cash flow reconciliation

Ten carts at 70 cups, monthly	Rp million
Net profit	50.49
Add back depreciation	5.89
Movement in working capital at steady state	0
Operating cash flow	56.38

Sales are settled at the pour, so there are no trade receivables. Stock is the only working capital of consequence and it does not move at a constant cart count. No debt and no distributions are assumed.

Taxation

assumption Small-enterprise treatment applies a final tax of 0.5% of turnover while annual turnover is below Rp4.8bn. Above that threshold, corporate income tax of 22% applies to taxable profit, with relief under Article 31E on the share of income attributable to the first Rp4.8bn. The figures apply the headline rates without that relief and should be confirmed with an accountant before filing.

The tax step is the largest single discontinuity in the model. In the base scenario cumulative revenue passes Rp4.8bn in month 12. At 97 carts tax is about Rp105m a month against Rp0.69m at ten carts, and net margin falls from 36.6% to 27.9% for that reason alone. In the conservative scenario first-year revenue is about Rp2.18bn and the threshold is not crossed in year one.

7 Ten-cart sensitivity

model output Ten carts held constant, 26 operating days a month, 1.25× load ratio, no reinvestment. Stated on the steady-state basis from month 3, after the motivation fee has expired. In the two fee months EBITDA is Rp11.9m at 30 cups and Rp25.8m at 40 cups. EBITDA is revenue less operating costs, before depreciation, interest and tax.

Rp57.1m

monthly EBITDA in the base case: ten carts at 70 cups per cart-day

41.4%

EBITDA margin on revenue of Rp137.8m

6.9 cups

per cart-day to break even on EBITDA

Cups per cart-day	All-in seller pay	Revenue	EBITDA	EBITDA margin	Net profit	Employee cost, % of revenue
30	1,163k	54.6m	17.9m	32.7%	11.7m	21.3%
40	1,473k	75.4m	29.1m	38.6%	22.8m	19.5%
50, conservative case	1,833k	96.2m	37.2m	38.6%	30.8m	19.1%
60	2,243k	117.0m	47.4m	40.5%	40.9m	19.2%
70, base case	2,703k	137.8m	57.1m	41.4%	50.5m	19.6%
80	3,163k	158.6m	66.8m	42.1%	60.1m	19.9%
100	3,883k	200.2m	85.6m	42.7%	78.7m	19.4%
120	4,503k	241.8m	108.0m	44.7%	100.9m	18.6%
140	5,123k	283.4m	127.8m	45.1%	120.5m	18.1%
150	7,883k	304.2m	114.5m	37.6%	107.1m	25.9%

Monthly EBITDA at ten carts, by cups per cart-day (Rp million)

Margin improves with volume to 45.1% at 140 cups. Two things drive it: the Rp6,000 cup dilutes less as volume rises, and employee cost settles at 18% to 20% of revenue. The fall at 150 cups is the top-band effect described in Section 3.

8 Operating bands

The bonus starts at 30 cups per cart-day and creates a step. Below it the seller earns commission alone and group margin is at its highest. At the threshold, group EBITDA falls. The table is on the steady-state basis from month 3.

Cups per cart-day	Visible seller pay	EBITDA, 10 carts	EBITDA margin
10	213k	2.9m	16.4%
20	426k	12.3m	34.7%
25	533k	17.0m	38.5%
29	637k	21.7m	41.3%
30, bonus begins	1,163k	17.9m	32.7%
34	1,287k	22.4m	35.6%
40	1,473k	29.1m	38.6%
50	1,833k	37.2m	38.6%

Monthly EBITDA at ten carts around the bonus threshold (Rp million)

Cups per cart-day. The bonus begins at 30 cups; the 29-cup level is recovered at 34.

Once the fee has expired the step is modest. Group EBITDA falls by Rp3.8m a month as carts cross from 29 to 30 cups, and that level is recovered at 34 cups, which is the steady-state threshold in the cull policy. During the two fee months the same crossing costs Rp9.8m and is not recovered until 38 cups, so a cart still inside its fee period is not judged against the steady-state threshold.

The high-margin band below 30 cups cannot be staffed. At 29 cups a seller takes home Rp637,000 a month. A cart at 20 cups will report Rp12.3m of group EBITDA across ten carts and lose its seller within weeks. Those rows are the cost of holding a cart while a relocation decision is made.

Three operating bands

Band	Characteristics	Action
Below 25 cups	High reported margin, but the seller cannot be retained. The Rp6,000 cup is below its cap, so blended contribution is at its weakest.	Relocate without delay
25 to 33 cups	Bonus in payment. EBITDA is below the same cart at 29 cups. The seller loses the motivation fee at month 3.	Intervene on daypart or site within 14 days
34 cups and above	The structure works as designed. Employee cost falls toward 19% and blended contribution rises with every further Rp8,000 cup.	Retain and analyse

Moving a cart from 30 to 50 cups is worth about Rp1.9m a month of EBITDA per cart and Rp670,000 of visible pay to the seller. The motivation fee buys the two months in which that movement has to happen. Where it does not happen, the fee expires and the cull policy removes the cart.

9 Capital structure, working capital and returns

assumption

The initial round is Rp200m in equity at 1% per Rp10m, so it buys 20% of the company. Rp150m is committed and Rp50m is open. Investors receive the first Rp100m of dividends. Each line below is a budget line, and contingency is the balance to Rp200m.

Fixed assets	Rp million	Working capital and launch	Rp million
10 carts at Rp9.9m, including transport	99.00	Opening stock, about 7 days, both products	12.00
Brewing and cold-chain equipment	20.00	Seller float, 10 at Rp300,000	3.00
Kitchen fit-out	18.00	Launch kit: uniforms, signage, consumables	6.00
Trackers, 10 at Rp365,000	3.65	Registration and legal	2.00
Subtotal	140.65	Operations set-up fee, one-off, capitalised	20.00
		Contingency	16.35
		Subtotal	59.35
			Rp million
Total capital requirement			200.00

Use of the Rp200m (Rp million). Fixed assets in black.

Ten carts, including transport	99.00
Brewing and cold-chain equipment	20.00
Operations set-up fee	20.00
Kitchen fit-out	18.00
Contingency	16.35
Opening stock	12.00
Launch kit	6.00
GPS trackers	3.65
Seller float	3.00
Registration and legal	2.00

Kitchen fit-out covers a rolling door (Rp6.0m), an electrical upgrade (Rp5.0m), plumbing and sink (Rp2.0m), shelving and stainless worktops (Rp3.0m), and floor and paint (Rp2.0m). Depreciation is Rp5.89m a month.

Working capital and cash conversion

Ten carts at 70 cups	Rp million	Days	Note
Trade receivables	0	0	All sales settled at the pour
Stock	10.57	7	Seven days of cost of goods
Seller float	3.00		Rp300,000 per cart
Trade payables	0	0	Suppliers paid on delivery
Net working capital	13.57	7	9.8% of monthly revenue

The cash conversion cycle is seven days.

Fourteen days of supplier credit would turn it negative and is worth about Rp21m at ten carts. It is not assumed anywhere in the model and should be negotiated before outside funding is considered.

Returns on capital

Measure	Value	Basis
Capital employed at launch	Rp200.0m	Fixed assets Rp140.65m plus working capital and launch Rp59.35m
EBIT, annualised at ten carts	Rp614.2m	70 cups per cart-day
Return on capital employed	307%	Annualised EBIT over capital employed
Cost to deploy one more cart	Rp14.27m	Rp9.9m cart, Rp0.365m tracker, Rp4.0m working capital
EBITDA from that cart	Rp5.77m a month	At 70 cups, net of marginal kitchen labour, replenishment, charging and telemetry
Return on incremental capital	40% a month	Payback on a marginal cart of 2.47 months

Returns of this size reflect an asset-light structure with no rent and no receivables. The constraint on the venture is the supply of viable pavements and the pace at which carts can be built and staffed.

10 Site portfolio

hypothesis Opening estimates by site type, to be replaced by measured results in the first weeks of trading. The realised spread is expected to be wider than shown.

Site type	Peak window	Estimated cups per day	Principal risk
Factory gate	06:00–08:00, 15:00–17:00	80–140	Two sharp peaks, inactive at midday
Campus	11:00–14:00	60–110	Stops during term breaks
Market	05:00–09:00	60–100	Over by mid-morning
Commuter node	06:00–09:00	50–90	Limited dwell time
Office frontage	07:00–09:00, 12:00–13:00	40–80	Competition from established outlets
Residential	Flat	20–40	No clear peak; sits in the middle band

The planned opening allocation is four factory gates, two campus sites, two market sites and two commuter sites, weighted toward the types whose estimated range clears 34 cups with room to spare. No residential sites are included at launch. The first wave also tests site types this table has no estimate for: hospitals, schools, clinics, fuel stations and evening retail. A bottom-up reading of the same estimates suggests a raw portfolio in the range of 40 to 55 cups before culling, which is why the 50-cup scenario is the planning case and 70 is the upside.

11 Reinvestment and network growth

Investors receive the first Rp100m of operating cash flow as dividends, half of their capital. After that, all operating cash flow is reinvested in carts. A cart funded from one month's cash flow is ordered, built, staffed and sited over the following month, and takes about three months to reach its full rate.

Parameter	Value	Designation
Cost to deploy one more cart	Rp14.27m (cart Rp9.9m, tracker Rp0.365m, working capital Rp4.0m)	Calculation
Site productivity	Uniform at the scenario level across all carts	Assumption
Order-to-street lag	One month for fabrication, recruitment and siting	Assumption
Productivity ramp	60% in month 1, 85% in month 2, 100% after	Assumption
Equipment tranche	Rp20m per additional 1,200 cups a day	Assumption
Kitchen	Rp18m fit-out per 3,600 cups a day	Assumption
Kitchen labour	One person per 400 cups a day	Fact, confirmed
Supervision	Rp4m a month per 10 carts beyond the first 10	Assumption
Deployment ceiling	10 additional carts a month	Assumption
Distributions	First Rp100m of operating cash flow to investors; reinvestment after that	Set by management

Expansion is bounded by two things: cash available to order carts, and the ceiling of ten new carts a month. Sites that fall below threshold are relocated under Section 13, so the network average is held up by culling the tail.

Carts trading by month (number of carts)

Base scenario: 70 cups per cart-day

model output Rp million except cart and cup counts. Carts ordered in one month start trading in the next at 60% of mature volume.

Month	Carts trading	Of which ramping	Cups per day	Revenue	EBITDA	Margin	Net profit	Paid to investors	Carts ordered	Closing cash
1	10		700	138	57	41.4%	50	56	0	0
2	10		700	138	57	41.4%	50	44	0	13
3	10		700	138	57	41.4%	50		4	12
4	14	4	868	170	63	37.0%	54		3	11
5	17	7	1,064	208	81	39.0%	71		6	6
6	23	9	1,410	275	103	37.5%	90		7	8
7	30	13	1,841	360	138	38.5%	122		8	10
8	38	15	2,362	462	178	38.5%	156		10	43
9	48	18	2,996	586	224	38.2%	197		10	83
10	58	20	3,675	719	275	38.2%	243		10	191
11	68	20	4,375	857	331	38.6%	293		10	375
12	78	20	5,075	995	384	38.6%	270		10	519

Investors receive their Rp100m in months 1 and 2, and the first new carts are ordered in month 3. From month 8 the deployment ceiling binds and cash builds faster than it can be applied, reaching Rp519m by month 12. The tax step arrives in month 12, where net profit falls on rising EBITDA.

Conservative scenario: 50 cups per cart-day

model output The same parameters throughout. Only cups per cart-day differs.

Month	Carts trading	Of which ramping	Cups per day	Revenue	EBITDA	Margin	Net profit	Paid to investors	Carts ordered	Closing cash
1	10		500	96	37	38.6%	31	37	0	0
2	10		500	96	37	38.6%	31	37	0	0
3	10		500	96	37	38.6%	31	27	0	10
4	10		500	96	37	38.6%	31		3	4
5	13	3	590	113	38	33.3%	30		2	12
6	15	5	688	131	45	34.6%	37		4	0
7	19	6	855	163	55	33.9%	45		3	12
8	22	7	1,010	193	65	33.5%	53		3	13
9	25	6	1,168	223	78	35.1%	64		6	4
10	31	9	1,408	269	89	33.1%	72		6	6
11	37	12	1,685	322	108	33.7%	89		7	13
12	44	13	2,015	385	129	33.4%	106		8	6

Investors receive their Rp100m by month 3 and the first new carts are ordered in month 4. The deployment ceiling is not reached in year one, so the pace of expansion is set by cash throughout. First-year revenue is about Rp2.18bn, below the Rp4.8bn tax threshold.

Position at month 12

Metric	Conservative, 50 cups	Base, 70 cups
Carts trading	44	78
Revenue per month	Rp385m	Rp995m
EBITDA per month	Rp129m	Rp384m
Revenue in year one	Rp2.18bn	Rp5.04bn
EBITDA in year one	Rp0.76bn	Rp1.95bn
Investors paid their first Rp100m	Month 3	Month 2

Growth paths

Monthly EBITDA by month (Rp million)

The dividend is the first call on cash. Against the same model with no dividend, the fleet at month 12 is 78 carts instead of 97 in the base scenario, and 44 instead of 69 in the conservative one. Paying the same Rp100m later, once the deployment ceiling binds, would cost no carts in the base scenario.

The constraint differs between the two scenarios. At 70 cups the venture is short of cash until month 7 and short of deployment capacity after that. At 50 cups the ceiling is not reached in year one and closing cash stays under Rp14m in every month. More capital would speed up the conservative scenario materially.

The deployment lag holds margin below steady state throughout the expansion. A ramping cart in the base scenario runs at 42 cups, where it earns the bonus and the motivation fee on middle-band economics. Margin runs near 38.6% during expansion against 41.4% at steady state. From month 8 in the base scenario, raising the deployment ceiling is the best use of management attention: a second fabricator, a dedicated recruiter or a second kitchen.

12 Measurement framework

Ten previously untested sites run under one coordinator, so the daily record is the only instrument that can tell a weak site from a weak seller or a late delivery. A record is kept per cart, per day, from the first day of trading, and every cart carries a GPS tracker.

Field recorded	Purpose
Cups sold by product, by hour	Shows whether the Rp6,000 cap binds and when, and separates a defined peak from a flat profile
Cups loaded against cups sold, by product	Sets the next load for each product; nil wastage indicates a stock-out
Arrival, opening and closing time	Separates a weak site from a short trading day
Days attended in the month	Qualification for the bonus band
Jug arrival time	Separates a weak site from a late replenishment
Weather, payday and holiday flags	Rain days and pay cycles are not comparable and are kept out of decision medians
Recognised repeat customers	A proxy for repeat custom; a site without repeats is selling on novelty
One recorded customer objection	The qualitative channel across the network
Seller	Attribution: sales are read by seller as well as by site

The product split carries the most information in the first fortnight. It shows whether the Rp6,000 cup is recruiting new buyers or displacing Rp8,000 sales, and the two outcomes point in opposite directions for the cap.

13 Cull and relocation policy

hypothesis Deploying to ten untested sites implies error on several of them. Relocation is cheap by design, because the carts are motorised and the sites carry no fee. A cart is judged against the gate that matches the stage it is in. The thresholds are set in advance of the data.

Stage	Measure	Gate	Why
Trial, day 14	Median of days 3 to 14	20 cups per day	The volume at which trial pay is covered; three separate derivations agree
Fee expiry, end of month 2 of paid trading	Monthly average	38 cups per day	Recovers the 29-cup EBITDA while the motivation fee is in payment
Steady state, from month 3	Median of days 8 to 14 of each review	34 cups per day	Recovers the 29-cup EBITDA once the fee has expired

Bands from month 3

Result	Action
Below 25 cups per day	Relocate without delay. The position cannot be staffed at Rp533,000 a month whatever the reported margin, and the Rp6,000 cap is not reached.
25 to 33 cups per day	Intervene on one variable, ordinarily the daypart, and hold for a further 14 days. Relocate if the cart has not cleared 34 cups by the end of the fee period.
34 cups and above	Retain unchanged and analyse. The strongest sites are the only source of a pattern that can be repeated.

Days 1 and 2 are excluded as novelty. A review is void where replenishment was late on more than two occasions or more than three days were lost to rain. A change of seller no longer voids a review, but no site is culled permanently without trading under at least two sellers.

14 Principal risks

Risk	Substance	Containment
The middle band	A large share of sites landing between 25 and 33 cups would leave the venture paying the bonus on carts that earn less than the same carts below the threshold. This is the most probable failure mode.	Site portfolio (Section 10) and cull policy (Section 13)
The tax threshold	Crossing Rp4.8bn of annual turnover moves tax from 0.5% of turnover to 22% of profit. In the base scenario this happens in month {b_tax}.	Provide for it from month 8
Month-3 attrition	Fee expiry cuts a 30-cup seller's pay by 34% and a 40-cup seller's by 18%. At weaker sites this produces a departure that coincides with site failure.	Two-seller rule; seller recorded in every row
The 150-cup band	The top rung lowers group EBITDA by about Rp13.3m a month at ten carts and is open to gaming.	Reviewed if any cart passes 120 cups
Cannibalisation by the Rp6,000 cup	If the entry price displaces Rp8,000 sales, blended contribution falls by up to Rp1,500 on each displaced cup.	The product split in the daily record
Uniform site productivity	The growth model assumes every cart performs at the scenario average. A real portfolio will spread.	Prompt culling of the tail
Load discipline	An undisciplined load ratio costs between Rp2m and Rp23m a month at ten carts.	Production rule in Section 4
Margin compression	Cost of goods rose by Rp300 and Rp200 per cup in the last revision with no price increase.	Price is the unused lever
Kitchen failure at volume	One kitchen supplies the whole network and is a single point of failure.	Capacity confirmed at 1,200 cups a day; second kitchen in the growth plan
Site tenure	Kerbside occupation without a fee is occupation at the discretion of others. It is confirmed at one pavement.	Backup sites on each route
Operating days	The assumption of 26 operating days a month is unsupported. At 22 days every projection in Sections 7 and 11 falls by roughly 15%.	Rain days flagged and kept in the record
Contingency	Rp16.35m is 8.2% of capital across ten untested sites.	Supplier credit of about Rp21m, not yet negotiated

15 Basis of preparation

Items designated assumption or hypothesis are not supported by observation and are replaced as trading data arrives.

Item	Value	Designation and status
Selling prices	Rp6,000 and Rp8,000 per cup	Fact, set by management
Cost of goods sold	Rp2,000 and Rp2,200 per cup	Fact, set by management
Rp6,000 product cap	15 cups per cart-day	Fact, set by management
Sales mix below the cap	60% Rp6,000, 40% Rp8,000	Assumption, unobserved
Seller commission	Rp700 and Rp1,000 per cup	Fact, set by management
Performance bonus	Section 3 ladder, from 30 cups; monthly and attendance-gated	Fact, set by management
Motivation fee	Undisclosed; at most 2 consecutive months	Fact, set by management
Site fee	Nil	Fact at one site only
Kitchen capacity	3 persons per 1,200 cups a day	Fact, confirmed
Service speed	Not a constraint: pre-brewed and poured over ice	Fact
Cart cost	Rp9.9m including transport	Assumption
Wastage per unsold cup	Rp1,150 and Rp1,200 by product	Fact, liquid only
Load ratio, planning basis	1.25×	Assumption, policy choice
Depreciation lives	Carts and trackers 24 months; equipment, fit-out and set-up fee 36 months	Assumption
Replenishment and charging	Rp10,000 and Rp3,000 per cart-day	Assumption
Telemetry hosting and SIM	About Rp0.45m a month at ten carts	Assumption
Operating days	26 per month	Assumption, unsupported
Taxation	0.5% of turnover below Rp4.8bn; 22% of profit above, without Article 31E relief	Assumption, to be confirmed
Stock holding	7 days of cost of goods	Assumption
Supplier credit	Nil assumed	Assumption, not yet negotiated
Supervision beyond 10 carts	Rp4m a month per 10 carts	Assumption
Deployment ceiling	10 carts a month	Assumption
Order-to-street lag and ramp	1 month; 60%, 85%, 100%	Assumption
Site productivity	Uniform at the scenario level	Assumption, held by culling
Cups by site type	Section 10	Hypothesis, no supporting evidence
Cups per cart-day in the ledgers	50 and 70	Hypothesis, unobserved
Cull thresholds	20 cups at day 14; 38 at fee expiry; 34 at steady state	Hypothesis, derived in Section 8
Minimum attendance for the bonus	26 days in the month	Set by management
Capital	Rp200m in equity at 1% per Rp10m; Rp150m committed	Fact, stated by management
Distributions	First Rp100m of operating cash flow to investors; reinvestment after that	Fact, set by management
All figures in Sections 5 to 11		Model output, not a forecast

Revision history

- **Revision A, 10 August 2026.** Two-price line, banded remuneration with a time-limited motivation fee, wastage as its own cost line, taxation, growth ledgers on two bases.
- **Revisions B and C, 14 August 2026.** Cost of goods raised to Rp2,000 and Rp2,200. Equipment reduced from Rp42m to Rp20m. Trackers priced at Rp3.65m. A one-off Rp20m operations set-up fee capitalised. Telemetry hosting added as a running cost. Wastage set at Rp1,150 and Rp1,200. Trial, fee-expiry and steady-state gates separated. Growth ledgers rebuilt.
- **This issue.** Redesigned for the initial round. Capital stated at Rp200m sought with Rp150m committed, and contingency carried as the balance. Growth ledgers re-run on revision C wastage with the first Rp100m of cash flow paid to investors.

16 Conclusion

Recommendation: proceed. Deploy ten carts against Rp200m of initial capital, pay investors their first Rp100m, then reinvest operating cash flow in further cohorts of up to ten carts a month, subject to the cull policy in Section 13.

Rp57.1m

monthly EBITDA at steady state in the base case, at a 41.4% margin

78 carts

and about Rp384m of monthly EBITDA by month 12 in the base case

44 carts

and about Rp129m of monthly EBITDA by month 12 in the conservative case

In the base case of 70 cups per cart-day the venture earns Rp57.1m of EBITDA a month at ten carts, pays investors their first Rp100m by month 2, and reaches about 78 carts by month 12. In the conservative case of 50 cups it pays the Rp100m by month 3 and reaches about 44 carts. EBITDA break-even is 6.9 cups per cart-day. A marginal cart costs Rp14.27m and returns about 40% a month at 70 cups.

The two-price line strengthens the economics as sites strengthen. The Rp6,000 cup is capped while growth arrives at Rp8,000, so blended contribution rises from Rp3,900 to Rp4,650 a cup across the operating range. The pay ladder steepens through the working range, and the motivation fee supports a new cart for the two months in which it is ramping.

Operating conditions

- A daily record kept per cart and per product from the first day of trading.
- Production reviewed for both products against recent sales, at the 1.25× buffer.
- A day-14 review against the trial gate and a review at fee expiry, both agreed before the data is read.
- Realised volume of each new cohort measured against the scenario, and the deployment ceiling raised before cash sits idle.
- Provision made from month 8 for the corporate income tax step after the Rp4.8bn threshold.
- Preparation rehearsed at the full 1,200-cup volume across both products before first trading.

The initial round

Rp200m

sought for 20% of the equity, at 1% per Rp10m

Rp150m

committed to date, with Rp50m still open

Rp100m

of first dividends to investors, half of their capital

Every projection in this book resolves to two measurable quantities: cups per cart-day, and the split between the two products. The first fourteen days of trading records replace Sections 5 to 11 with observed figures.
